# **SP+ Scripting Manual**

*Copyright © 2021, AKCP*

A new feature has been added to sensorProbe+ family: Lua Script Sensor, custom scripting for sensor value calculations.

These scripts support using the [Lua programming language](#)'s math library.

## What is Lua?

Lua is a powerful, efficient, lightweight, embeddable scripting language. It supports procedural programming, object-oriented programming, functional programming, data-driven programming, and data description.

Lua combines simple procedural syntax with powerful data description constructs based on associative arrays and extensible semantics. Lua is dynamically typed, runs by interpreting bytecode with a register-based virtual machine, and has automatic memory management with incremental garbage collection, making it ideal for configuration, scripting, and rapid prototyping.

## SP+ implementation

The following Lua 5.3 language features are fully supported: variables, tables, loops, conditions, functions.

The limitations for running scripts on SP+ is up to 4KB script size and 30KB runtime memory; up to a maximum of 80 individual scripts can be defined.

As noted earlier, SP+ only supports the math library of Lua. For example, the following is valid:

```
return math.sqrt(math.pi)
```

For tutorials about how to use the Lua math library, please refer to these pages:

<http://lua-users.org/wiki/MathLibraryTutorial>

[https://www.tutorialspoint.com/lua/lua\\_math\\_library.htm](https://www.tutorialspoint.com/lua/lua_math_library.htm)

<https://www.lua.org/manual/5.3/manual.html#6.7>

SP+ provides 5 main Lua libraries for the custom scripts. Mostly the Sensor and Math libraries are used by custom script calculations.

- 1. Sensor:** The Sensor library provides functions to access the sensors connected to the SP+ device. The "vsens" library can be used to access virtual sensors.
- 2. Math:** The Math library comprises a standard set of mathematical functions.
- 3. Operating system:** This library includes functions for getting the current system time.
- 4. Script:** This library provides information about the currently running Lua script.
- 5. Storage:** This library allows to keep values between Lua interpreter runs.

Please refer to the "*List of all available commands*" section at the end of this manual for the list of all functions list for these libraries.

You can access other sensors' values by calling the `sensor.find()` function. The function has one argument: `sensorId`, and returns a table with fields: `id`, `status_update_time`, `value`, `status`, `acknowledge`

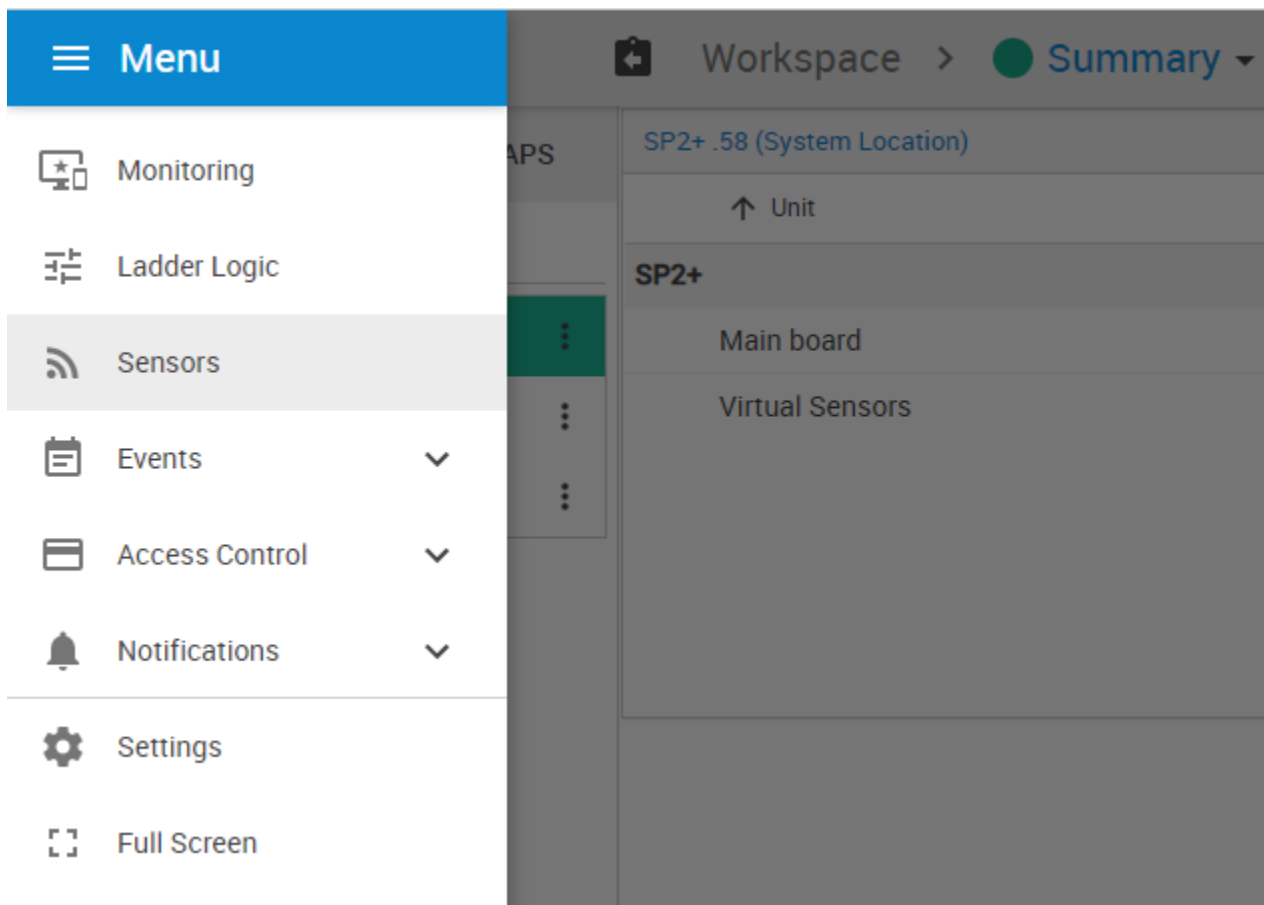

For example, using the physical RJ45 Sensor Port 1's value:

```
s = sensor.find(0)
return s.value * 5
```

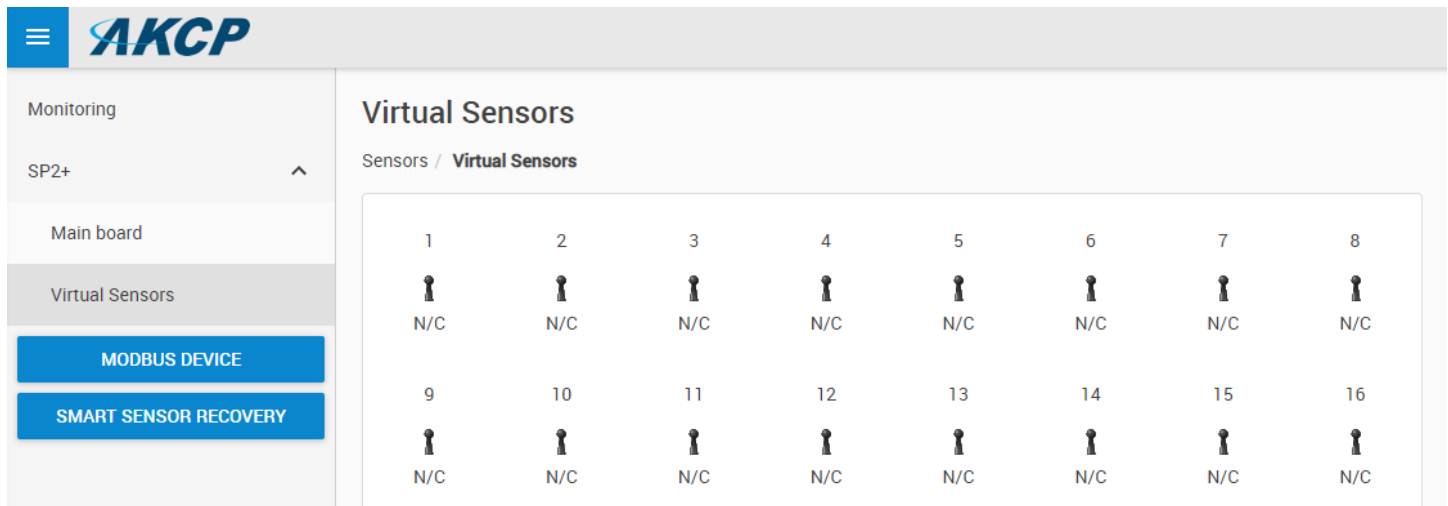

To find the correct Sensor ID, you should use the "Add Command" wizard (see below in the manual).

### Script sensor usage

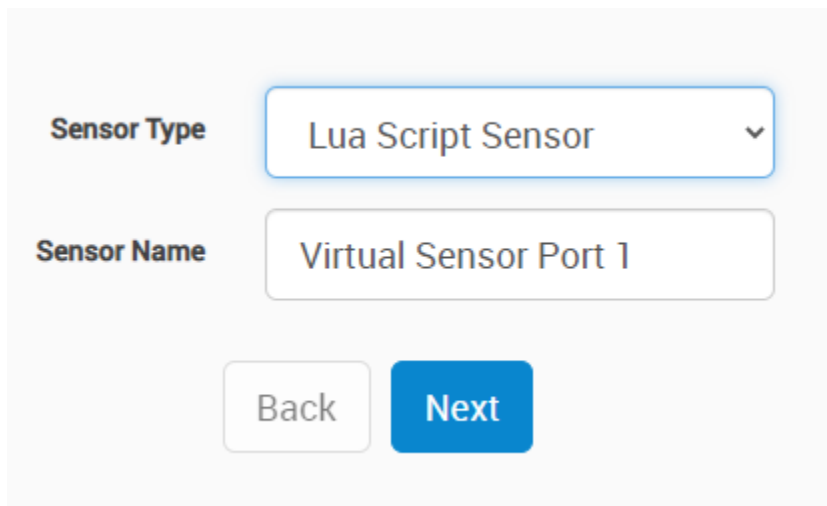

You can add a new script sensor the usual way through the Virtual Sensors interface. Open the **Menu / Sensors**:

Choose **Virtual Sensors** (note: you may need additional licenses) and click on a new VS:

Choose **Lua Script Sensor** from the drop-down menu and type in a custom **Sensor Name** (up to 16 characters):

When you are creating a new Lua Script Sensor, the script ID will be automatically assigned to it, depending on the chosen VS number.

For example, choosing VS #1 will give your script sensor the ID #1. Choosing VS #5 will have ID #5. Up to 80 IDs can be used (id:1..80).

If you would only like to make simple arithmetic calculations on sensor values, you may choose **Arithmetic** type and use the sensor selection drop-down menus then choose your calculation method:

Lua Script Sensor   **Advanced**   Virtual Sensor Setting   Polling Setting   Continuous Time   Status Text

**Lua Script**

Lua Script  
 Ladder Diagram  
 Arithmetic

Arithmetic Type  
Average

Arithmetic Expression  
sensor.avg((A,B,C,D))   **TEST**

<b>A</b>	Sensor WT-TH#1 Temperature	×
<b>B</b>	Sensor WT-TH#2 Temperature	×
<b>C</b>	Sensor WT-TH#3 Temperature	×
<b>D</b>	Sensor WT-TH#4 Temperature	×
<b>E</b>	Sensor -	×
<b>F</b>	Sensor -	×

Click on the **Test** button to see a result of the calculation, which will also be the new sensor's value. In this manual we focus on the custom scripting; using the arithmetic calculations are straight-forward.

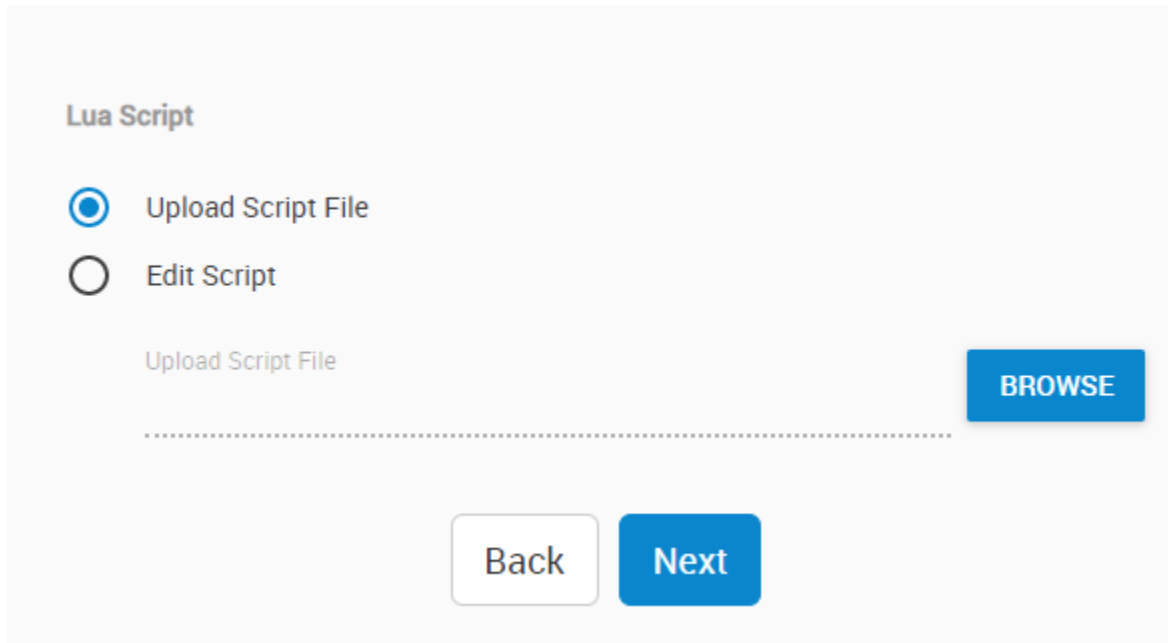

*Note:* sensors with invalid status will not be used in the value and status calculation of the Lua Arithmetic Virtual Sensor.

For a Lua custom script sensor, you will need to define the script's contents.

You can either add a script by uploading a predefined script file, or by editing the script directly in the WebUI.

To remove your script, offline the virtual sensor.

To upload a script, click on **Browse** and select it from your computer:

**Lua Script**

Upload Script File

Edit Script

Upload Script File BROWSE

.....

Back Next

**Notes:**

- You can upload files up to 4KB size
- The file extension must be .LUA
- The line ending format could be either Windows (CR LF) or Unix (LF), both are supported

To edit the script in WebUI, you can either type in the script directly, or use the built-in helper functions by using the **Add Command** button (see details below):

**Lua Script**

Upload Script File

Edit Script

Script Content  
|

---

ADD COMMAND TEST

Back Next

The executed Lua script will return a value (integer, float or boolean types). The returned value will be used as virtual sensor value. For example, the simplest working Lua script is:

```
return 45
```

Which will return the static integer value 45.

Using the **Add Command** menu will display a wide range of selectable commands. Please refer to the “*List of all available commands*” section at the end of this manual for the list of all available choices and combinations.

For example, choose a Sensor **Command Type** (default selected). Then as **Command Function** the sensor’s reading. Then choose the actual sensor on your device (physical or virtual) from the sensors list.

The “**Output**” line will show the actual correct command that the wizard will add to your script file:

### Add Command

Command Type  
Sensor

Command Function  
Reading

Sensor

Search

- ^ SP2+ .58 (192.168.1.58)
  - ^ Main board
  - ^ Virtual Sensors
    - Script Sensor Port 1

Output: `sensor.find(50331648).value`

CANCEL ADD

There are many other kinds of **Command Types** available:

**Sensor**

Operating system

Script

Storage

Math

The **Command Function**'s list will depend on the selected Command Type. For example, for the Sensors you could select the following:

**Reading**

Status

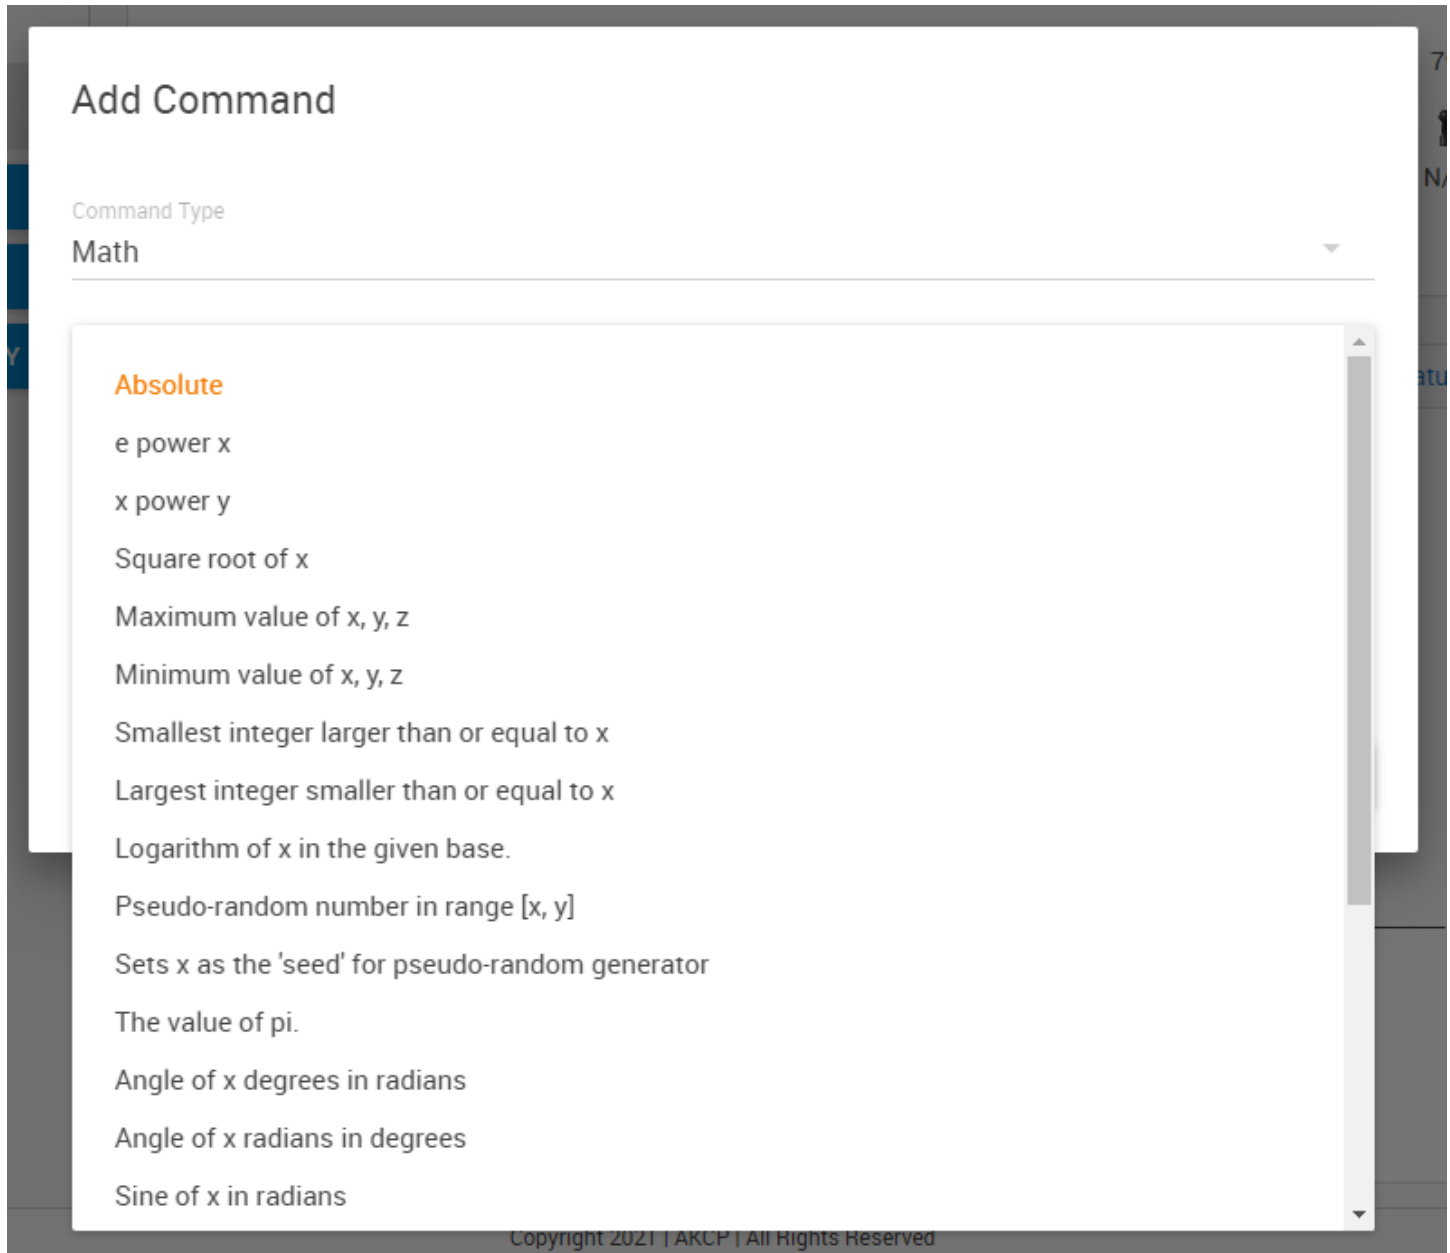

Acknowledge

Update time

ID

Please refer to the "*List of all available commands*" section at the end of this manual for the list of all available choices and combinations.

As another example, by choosing Math as Command Type, you will be given the Command Function selection as a list of possible math operations:

The screenshot shows a dialog box titled "Add Command". At the top, there is a label "Command Type" and a dropdown menu currently set to "Math". Below this, a scrollable list of math operations is displayed. The word "Absolute" is highlighted in orange. The list includes:

- Absolute
- e power x
- x power y
- Square root of x
- Maximum value of x, y, z
- Minimum value of x, y, z
- Smallest integer larger than or equal to x
- Largest integer smaller than or equal to x
- Logarithm of x in the given base.
- Pseudo-random number in range [x, y]
- Sets x as the 'seed' for pseudo-random generator
- The value of pi.
- Angle of x degrees in radians
- Angle of x radians in degrees
- Sine of x in radians

At the bottom of the dialog box, the text "Copyright 2021 | AKCP | All Rights Reserved" is visible.

When you are done editing, click on the **Test** button to check your script.

If there is any syntax errors or other issues, the WebUI will display a warning popup and a hint on which line the error is:

The screenshot displays a Lua script editor interface. At the top, a red error popup is visible with the text: **▲ Error!**  
Test script error :2: syntax error near 'return'

The script content is displayed in a grid format with line numbers 65 to 80. Each line is preceded by a key icon and the text 'N/C'. The error message points to line 67.

Below the script content, the 'Lua Script' section is shown with two radio button options: 'Upload Script File' (unselected) and 'Edit Script' (selected).

The 'Script Content' section shows the following code:  
script.id  
return 45

At the bottom, there are four buttons: 'ADD COMMAND', 'TEST', 'Back', and 'Next'.

If there are no errors with your script, the script's return value will be displayed in a green popup:

The screenshot displays a script testing interface. At the top, a green popup box shows a successful test result: "✓ Test script result: 45.000000". Below this, a grid of 80 numbered cells (65-80) is shown, each with a key icon and "N/C" (Not Connected) status. The interface includes a "Lua Script" section with two radio buttons: "Upload Script File" (unselected) and "Edit Script" (selected). Below the radio buttons, the "Script Content" is displayed as "return 45". At the bottom, there are four buttons: "ADD COMMAND", "TEST", "Back", and "Next".

Make sure to always test your script before saving it!

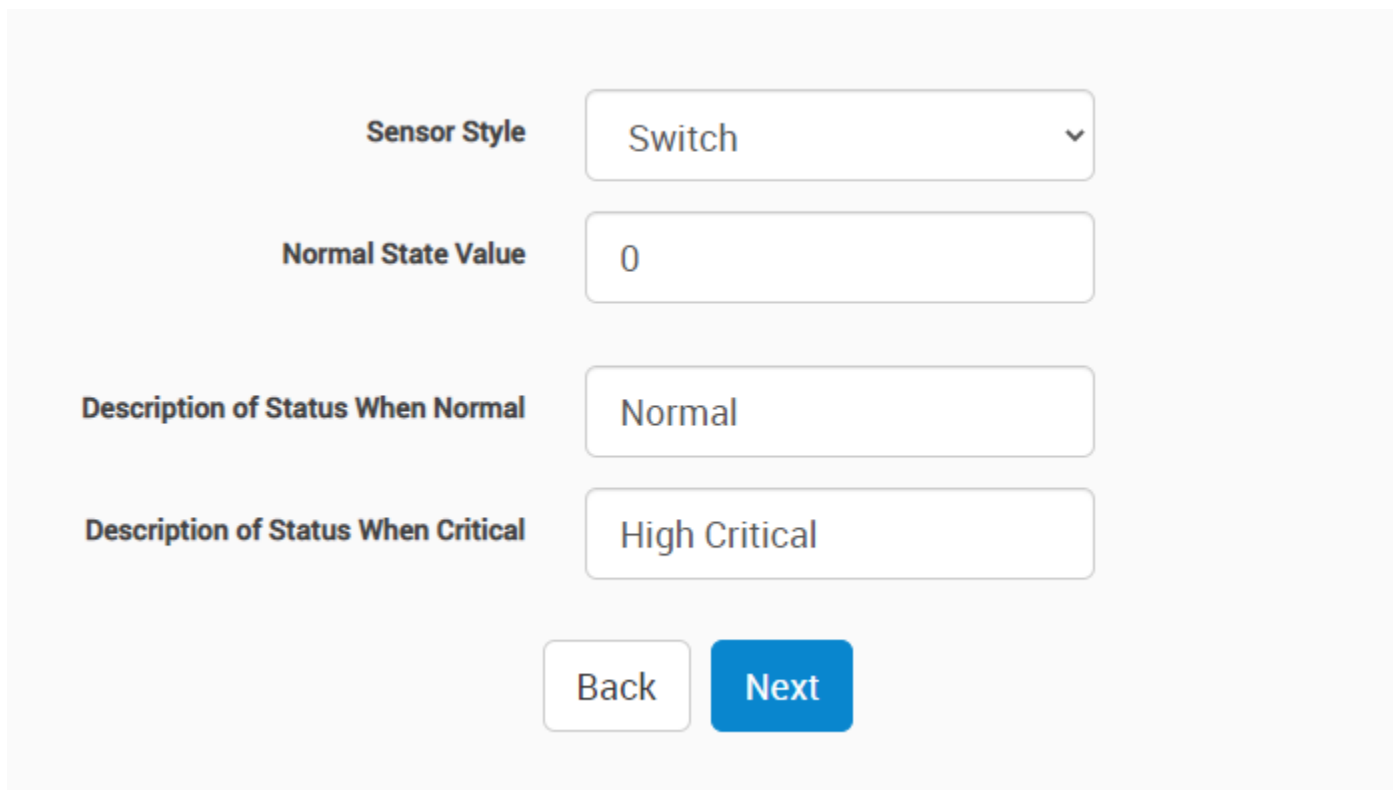

Next, choose the **Sensor Style** between Switch or Analog.

These options are similar to other AKCP sensors and therefore we will not detail all settings in this manual.

You would always need to choose the appropriate Sensor Style depending on your script's output and usage.

You could choose Switch style for example if your script will return a fixed number.

Set the Normal State Value to this expected number and your custom script's status will be Normal. Any other return value that the script gets will result in the VS to be High Critical.

The screenshot shows a configuration form with the following fields and values:

- Sensor Style**: A dropdown menu with the value "Switch" and a downward arrow.
- Normal State Value**: A text input field containing the number "0".
- Description of Status When Normal**: A text input field containing the word "Normal".
- Description of Status When Critical**: A text input field containing the words "High Critical".

At the bottom of the form, there are two buttons: "Back" (a white button with a grey border) and "Next" (a solid blue button).

Choose the Analog style if you would want to have multiple statuses depending on the script's output. Modify the thresholds accordingly.

Sensor Style

Low Critical     Low Warning    Normal     High Warning     High Critical

-1000000 →  →  →  →  → 1000000

Value Multiplier

Unit

Min Value

Max Value

Normal

Low Warning

Low Critical

High Warning

High Critical

Sensor Error

Set the **Polling Interval** as the final step. This defines how often the script will be executed. The default is 15 seconds.

Polling Interval  15s

The script will display the current status or reading, depending on your chosen Sensor Style:

Lua Script Sensor [Advanced](#) [Virtual Sensor Setting](#) [Polling Setting](#) [Continuous Time](#) [Status Text](#)

**Sensor Name**

**Sensor Status** **Normal**

**Sensor Currently**

**Sensor Enabling**

**Normal State Value**

## Script examples

### ***3 sensor values calculation***

The following example script will do calculations on 3 sensor values:

```
-- Enter your preferred Virtual Sensors here

virtualSensorPartA = 1
virtualSensorPartB = 2
virtualSensorPartC = 3

-----

-- Value preparation

partAValue = vsens.find(virtualSensorPartA).value
partBValue = vsens.find(virtualSensorPartB).value
partCValue = vsens.find(virtualSensorPartC).value

-- Calculation starts here

partialValue = partAValue + partBValue + partCValue

if partialValue == 0 then
  return -100
else
  return partialValue
end
```

You may modify the last part of the script in this way, if the check should result in sensor error status when the partialValue is 0:

```
if partialValue == 0 then
  error ('partialValue is ' .. partialValue)
else
  return partialValue
end
```

***PUE value calculation***

The following example script will do calculations for PUE with 3 sensor values (the partialValue is considered the IT power consumption):

```
-- Enter your preferred Virtual Sensors here
```

```
virtualSensorTotal = 1  
virtualSensorPartA = 2  
virtualSensorPartB = 3
```

```
-- Value preparation
```

```
totalValue = vsens.find(virtualSensorTotal).value  
partAValue = vsens.find(virtualSensorPartA).value  
partBValue = vsens.find(virtualSensorPartB).value
```

```
-- Calculation starts here
```

```
partialValue = partAValue + partBValue
```

```
if partialValue == 0 then  
return -100  
end
```

```
pue = totalValue / partialValue
```

```
return pue
```

The following example script is a modification to the earlier simpler PUE script, adding further calculations to the PUE:

```
-- Enter your preferred Virtual Sensors here

virtualSensorTotal = 1
virtualSensorPartA = 2
virtualSensorPartB = 3

-----

-- Value preparation

totalValue = vsens.find(virtualSensorTotal).value
partAValue = vsens.find(virtualSensorPartA).value
partBValue = vsens.find(virtualSensorPartB).value

-- Calculation starts here

partialValue = partAValue + partBValue

if partialValue == 0 then
  return -100
end

pueInt = math.floor(totalValue / partialValue)
rest = totalValue - (pueInt * partialValue)
pue = ((pueInt * 100) + (rest * 100) / partialValue)

return pue
```

### ***Advanced continuous time calculation***

The following example script will do calculations for the continuous time:

```
-- Calculate continuous time, in seconds, when the value of Virtual sensor 1 is
greater than 100
value = vsens.find(1).value
threshold = 100

if value < threshold then
    storage.reset('t100')
    return 0
end

start_time = storage.get('t100')
if not start_time then
    storage.set('t100', os.time())
    start_time = os.time()
end
return os.time() - start_time
```

For more scripting examples, please refer to the “*List of all available commands*” section at the end of this manual.

**List of all Lua functions provided by SP+ device**

```
sensor.find(id) -> { id, status_update_time, value, status, acknowledge }
vsens.find(index) -> index=1-80
os.time()
os.clock()
script.id
script.run(id)
storage.id
storage.clear()
storage.reset(key)
storage.set(key, value)
storage.setTimer(key, expireMs)
storage.get(key) -> value
storage.timerExpired(key) -> bool
```

For detailed descriptions of the functions with scripting examples, please refer to the “*List of all available commands*” section at the end of this manual.

## List of all available commands for Add Command wizard

Command Type	Command Function	Command syntax	Description	Example Usage
Sensor	<i>Reading</i>	sensor.find(<SensorID>).value vsens.find(<VirtualSensorIndex>).value	Get sensor reading (value)	-- Return value of sensor port 1 subport 1 as Lua Virtual Sensor value return sensor.find(0).value
Sensor	<i>Status</i>	sensor.find(<SensorID>).status vsens.find(<VirtualSensorIndex>).status	Get sensor status	-- Return status of sensor port 1 subport 2 as Lua Virtual Sensor value return sensor.find(1).status
Sensor	<i>Acknowledge</i>	sensor.find(<SensorID>).acknowledge vsens.find(<VirtualSensorIndex>).acknowledge	Get sensor status "Acknowledged" flag. When sensor status turned Warning / Critical, user can manually acknowledge the sensor status in SPX+ summary page by pressing "..." >>> Acknowledge on the desired sensor.  Value: 0 if the sensor status is not acknowledged (default), 1 if it is.	-- Return sensor status "Acknowledged" flag of Virtual Sensor 1 as Lua Virtual Sensor value return vsens.find(1).acknowledge
Sensor	<i>Last status change timestamp</i>	sensor.find(<SensorID>).status_update_time vsens.find(<VirtualSensorIndex>).status_update_time	Get sensor last status update time	-- Store update time of sensor port 2 subport 1 into a variable -- This can be used for further calculation lastUpdateTime = sensor.find(257).status_update_time
Sensor	<i>ID</i>	sensor.find(<SensorID>).id vsens.find(<VirtualSensorIndex>).id	Get sensor ID	-- Get sensor ID of Virtual Sensor 10 -- This can be used for further calculation  virtualSensorId = vsens.find(10).id

Command Type	Command Function	Command syntax	Description	Example Usage
Operating system	<i>Operating system timestamp</i>	os.time()	Get current UNIX timestamp	-- Check if it is working hours by UTC local utc_hour = os.time() / (60*60) % 24 return 10 <= utc_hour and utc_hour <= 18
Operating system	<i>Operating system clock</i>	os.clock()	Get time from device start, in milliseconds	-- The sensor will show the device uptime return os.clock()

Command Type	Command Function	Command syntax	Description	Example Usage
<b>Script</b>	<i>Script ID</i>	script.id	Get current Lua script ID. Equals to Lua virtual sensor index.	-- Return previous value return vsens.find(script.id).value
<b>Script</b>	<i>Script Execute</i>	script.run(<LuaScriptID>)	Run Lua script by ID	-- Reuse another Lua script return script.run(40)

Command Type	Command Function	Command syntax	Description	Example Usage
<b>Storage</b>	<i>ID</i>	storage.id	Get current storage ID. Equals to Lua virtual sensor index.	-- Return previous value return vsens.find(storage.id).value
<b>Storage</b>	<i>Clear</i>	storage.clear()	Remove all the keys from current storage	storage.clear()
<b>Storage</b>	<i>Reset</i>	storage.reset(<Key>)	Remove selected key from current storage	storage.reset('myKey')
<b>Storage</b>	<i>Set</i>	storage.set(<Key>,<Value>)	Save value to key	-- Set 'myKey' to 50 storage.set('myKey', 50)
<b>Storage</b>	<i>Get</i>	storage.get(<Key>)	Get saved value	-- Get 'myKey' value, or 100 if 'myKey' was not set yet -- Value is available even if set on a previous Lua run return storage.get('myKey') or 100
<b>Storage</b>	<i>Set timer</i>	storage.setTimer(<TimerKey>,<TimeMs>)	Set timer to key	-- Timer will be expired in 1 second storage.setTimer('myTimer', 1000)
<b>Storage</b>	<i>Check timer expired</i>	storage.timerExpired(<TimerKey>)	Check if timer is expired	return storage.timerExpired('myTimer')

Command Type	Command Function	Command syntax	Description	Example Usage
<b>Math</b>	<i>Absolute</i>	math.abs(<Value>)	Return the absolute, or non-negative value, of a given value.	> = math.abs(-100) 100 > = math.abs(25.67) 25.67 > = math.abs(0) 0
<b>Math</b>	<i>e power x</i>	math.exp(<x>)	math.exp(x) returns e (the base of natural logarithms) raised to the power x.	> = math.exp(0) 1 > = math.exp(1) 2.718281828459 > = math.exp(27) 532048240601.8
<b>Math</b>	<i>x power y</i>	x ^ y	Return x power by y	> = 2 ^ 10 1024 > = 10 ^ -1 0.100000 > = -5 ^ -3.123 -0.006563
<b>Math</b>	<i>Square root of x</i>	math.sqrt(<x>)	Return the square root of a given number. Only non-negative arguments are allowed.	> = math.sqrt(100) 10 > = math.sqrt(1234) 35.128336140501 > = math.sqrt(-7) -1.#IND
<b>Math</b>	<i>Maximum value of x,y,z</i>	math.max(<x>, <y>, <z>)	Return the maximum value from a variable length list of arguments.	> = math.max(1.2, -7, 3) 3 > = math.max(1.2, 7, 3) 7 math.modf
<b>Math</b>	<i>Minimum value of x, y, z</i>	math.min(<x>, <y>, <z>)	Return the minimum value from a variable length list of arguments.	> = math.min(1,2) 1 > = math.min(1.2, 7, 3) 1.2 > = math.min(1.2, -7, 3) -7

<b>Math</b>	<i>Smallest integer larger than or equal to x</i>	<code>math.ceil(&lt;Value&gt;)</code>	Return the integer no greater than or no less than the given value (even for negatives)	<pre>&gt; = math.floor(0.5) 0 &gt; = math.ceil(0.5) 1 &gt; = math.floor(-0.5) -1 &gt; = math.ceil(-0.5) -0</pre>
<b>Math</b>	<i>Largest integer smaller than or equal to x</i>	<code>math.floor(&lt;Value&gt;)</code>		
<b>Math</b>	<i>Logarithm of x in the given base</i>	<code>math.log(&lt;x&gt; [, base])</code>	Returns the logarithm of x in the given base. The default for base is e (so that the function returns the natural logarithm of x).	<pre>&gt; = math.log(532048240601) 26.9999999999998 &gt; = math.log(3) 1.0986122886681 &gt; = math.log(100, 10) 2.000000</pre>
<b>Math</b>	<i>Returns the integral fractional parts of x</i>	<code>math.modf(&lt;x&gt;)</code>	Returns the integral part of x and the fractional part of x. Its second result is always a float.	<pre>modResult = {math.modf(-5.3)} -- The function returns 2 values (integral and fractional parts) and it can be accessed as follows return modResult[1] -- &lt;&lt; -5.000000 return modResult[2] -- &lt;&lt; -0.300000</pre>
<b>Math</b>	<i>Pseudo-random number in range [x, y]</i>	<code>math.random([x [, y]])</code>	<p>When called without arguments, returns a pseudo-random float with uniform distribution in the range [0,1). When called with two integers m and n, <code>math.random</code> returns a pseudo-random integer with uniform distribution in the range [m, n]. (The value n-m cannot be negative and must fit in a Lua integer.) The call <code>math.random(n)</code> is equivalent to <code>math.random(1,n)</code>.</p> <p>This function is an interface to the underlying pseudo-random generator function provided by C.</p>	<pre>&gt; = math.random() 0.0012512588885159 &gt; = math.random() 0.56358531449324 &gt; = math.random(100) 20 &gt; = math.random(100) 81 &gt; = math.random(70,80) 76 &gt; = math.random(70,80) 75</pre>
<b>Math</b>	<i>Sets x as the 'seed' for pseudo-random generator</i>	<code>math.randomseed(&lt;x&gt;)</code>	Sets x as the "seed" for the pseudo-random generator: equal seeds produce equal sequences of numbers.	<pre>math.randomseed(1234) return math.random() -- &lt;&lt; always 0.915030</pre>
<b>Math</b>	<i>The value of pi</i>	<code>math.pi</code>	The value of $\pi$ .	<pre>&gt; = math.pi 3.1415926535898</pre>

<b>Math</b>	<i>Angle of x degrees in radians</i>	<code>math.rad(&lt;x&gt;)</code>	Convert from degrees to radian.	<code>&gt; = math.rad(180)</code> <code>3.1415926535898</code> <code>&gt; = math.rad(1)</code> <code>0.017453292519943</code>
<b>Math</b>	<i>Angle of x radians in degrees</i>	<code>math.deg(&lt;x&gt;)</code>	Convert from radian to degrees	<code>&gt; = math.deg(math.pi)</code> <code>180</code> <code>&gt; = math.deg(math.pi / 2)</code> <code>90</code>
<b>Math</b>	<i>Sine of x in radians</i>	<code>math.sin(&lt;x&gt;)</code>	Return the cosine, sine and tangent value for a given value in radians.	<code>&gt; = math.cos(math.pi / 4)</code> <code>0.70710678118655</code> <code>&gt; = math.sin(0.123)</code> <code>0.12269009002432</code> <code>&gt; = math.tan(5/4)</code> <code>3.0095696738628</code> <code>&gt; = math.tan(.77)</code> <code>0.96966832796149</code>
<b>Math</b>	<i>Cosine of x in radians</i>	<code>math.cos(&lt;x&gt;)</code>		
<b>Math</b>	<i>Tangent of x in radians</i>	<code>math.tan(&lt;x&gt;)</code>		
<b>Math</b>	<i>Arc sine of x in radians</i>	<code>math.asin(&lt;x&gt;)</code>	Return the inverse cosine and sine in radians of the given value.	<code>&gt; = math.acos(1)</code> <code>0</code> <code>&gt; = math.acos(0)</code> <code>1.5707963267949</code> <code>&gt; = math.asin(0)</code> <code>0</code> <code>&gt; = math.asin(1)</code> <code>1.5707963267949</code>
<b>Math</b>	<i>Arc cosine of x in radians</i>	<code>math.acos(&lt;x&gt;)</code>		

<b>Math</b>	<i>Arc tangent of y/x in radians</i>	<code>math.atan(y [, x])</code>	Return the inverse tangent in radians. We can do this by supplying y/x ourselves or we can pass y and x to <code>math.atan</code> to do this for us.	<pre>&gt; c, s = math.cos(0.8), math.sin(0.8) &gt; = math.atan(s/c) 0.8 &gt; = math.atan(s,c) 0.8 &gt; = math.atan(10) 1.471128</pre>
<b>Math</b>	<i>Value larger than or equal to any other numerical value</i>	<code>math.huge</code>	The float value <code>HUGE_VAL</code> , a value larger than any other numeric value.	<pre>&gt; = math.huge inf &gt; = math.huge / 2 inf &gt; = -math.huge -inf &gt; = math.huge/math.huge -- indeterminate nan &gt; = math.huge * 0 -- indeterminate nan &gt; = 1/0 inf &gt; = (math.huge == math.huge) true &gt; = (1/0 == math.huge) true</pre>
<b>Math</b>	<i>Remainder of the division of x by y that rounds the quotient towards zero</i>	<code>math.fmod(&lt;x&gt;, &lt;y&gt;)</code>	Returns the remainder of the division of x by y that rounds the quotient towards zero. (integer/float)	<pre>&gt; = math.fmod(10, 2) 0 &gt; = math.fmod(-5, 3) -2.000000 &gt; = math.fmod(6.6, 2.5) 1.600000</pre>

Please contact [support@akcp.com](mailto:support@akcp.com) if you have any further technical questions or problems.

**Thanks for Choosing AKCP!**
